

Notification (Webhook) (PAYIN/PAYOUT)

content type: application/json

method: POST

We will send notification to merchant on notification url which we have already received in payin/payout request.

Notification Request Parameters:

Parameter	Datatype	Information
payment id	Big int	Our payment id
payment status	String	Payment status
payment create date	String	Payment created date (UTC)
payment amount	Double	Payment amount
payment_ref_id	String	Merchant unique payment id
currency	String	Payment currency
payment_response_message	String	Response message
request_signature	String	Request signature
payment_utr_number	String	Bank unique txn number. (Only get for payouts)

Use **SHA256** algorithm to create request_signature.

Plaintext to generate request_signature for **payin/payout**

```
(
    request_payload.request_authkey||
    request_payload.payment_id||
    request_payload.payment_status||
    (request_payload.payment_amount * 100)||
    request_payload.payment_ref_id||
    request_payload.currency||
    secretkey
)
```

Ex:

Plaintext = db2f0195-05f3-442e-a046-623a38faa402||235235||CAPTURED||1000||68456463||INR||20c13a7f-15bd-485c-9793-38c7f78345e7

SHA256 result will be:

879656d05b140201c9a93d8876f93340c399d82b9ebbda35a870c44a3cf6a5bf

Key notes:

- secretkey will be in lower case. (it will be provided by us)

Json request body:

```
{
  "payment_id": "123",
  "payment_status": "FAILED",
  "payment_create_date": "2023-01-23 05:00:34",
  "payment_amount": 10,
  "payment_ref_id": "34324324",
  "currency": "INR",
  "payment_response_message": "Failed at bank",
  "request_signature": "45324324324132k4jkl324j32kl4j32lkj4j32l4jk23k4j324"
}
```

Json response body:
